
Let's define what an Internal Environmentalist is.

An Internal Environmentalist is one who is skilled at determining the ill health effects of our internal terrain and the cells that live within as defined via the body fluids, more specifically the blood, urine, and saliva.

"Heather King is a board Certified Internal Environmentalist who brings with her a world of clinical expertise to Health and Wellness here in London Ontario."

Dr. R.J. Folkard

These skills include:

- **Live & Dried Blood Auditing**
- **Fluid Auditing**
- **Lymphology**
- **Iridology**
- **Auriculotherapy**
- **Metabolic Nutrition**
- **Vibrational Therapy**

Your body is the "environment for your cells". An Internal Environmentalist performs a detailed examination of the body at a cellular level.

So, how exactly do we do that?

Using state of the art technology we can exact an intrinsic evaluation of the properties of individual blood cells to truly read your bodies health history.

What that means is we use a high-powered video microscope to search out the vital information plainly visible to the trained eye of the Internal Environmentalist. We say plainly visible because you will be able to clearly see the same information on the video monitor.

How do you feel?

Are you Tired OVERWEIGHT

Suffering with arthritis

Do you have

Cancer, Gout, Diabetes

Immune disorders, Constant Headaches,

Recurrent Infections

???

What are you doing to change it and is it working?

The truth is that the root cause of the way you feel may not have anything to do with what you think it is or what you have been told. Your cells have a story to tell and we have the means to read that story to you in great detail.

Isn't it time you heard what your body is trying to tell you

???

Cellular Affairs

*Only you know
how you feel*

You have questions

*Your blood
has answers*

“Your internal environment is a perfect reflection of how you feel.”

Through **Live and Dried Blood Auditing** we view the terrain of the blood to catch a glimpse of overall toxicity and pH imbalances. Once we determine what your imbalances are together we can begin the journey toward true and lasting health.

If your blood cells are not healthy, this is simply why you don't feel well too! This does not mean, however, that the writing is already on the wall. There are ways to bring your blood and your internal environment back to a healthy state of being.

What is Live and Dried Blood Auditing?

Live unchanged blood auditing

This is a method of examining the blood *before* it has died. This is different from standard (dead) blood testing because the blood is still alive and the quality and health of your blood can be clearly seen.

Among other things we are able to see bacterial and viral overloads, parasitic infestations, pH imbalances and nutritional deficiencies.

Dried Blood Auditing

Is an educational tool used to show organ stress including the Kidneys, Heart, Liver, Colon, and much more. We can also see the level of degeneration and free radical stress within the body which may not as yet have manifested as symptoms or illness.

Is this a new idea?

While we are using state of the art technology the idea of live and dried blood auditing has been around since the early 1920's. Scientists have been studying the hidden secrets of the blood for almost a century and have accumulated data to support this clinical research.

There are four main contributing factors for cellular health:

1. Cellular Environment
2. Cellular Communication
3. Cellular Nutrition
4. Cellular Exercise

If providing all of these four factors to your cells is not part of your routine, your cellular health will begin to suffer.

Your Internal Environmentalist is a highly trained clinician with the skills to help you move toward a healthier happier future.

Will it hurt?

We are not the least bit interested in causing you more discomfort but we will have to take a mere 4 drops of blood out of your finger. We promise this will be only slightly more uncomfortable than being bitten by a mosquito at the cottage.

These four drops of blood are then placed on separate slides to be viewed on a large LCD screen via a high-powered microscope.
